

Technical information

About Blu-ray

Blu-ray is a digital optical disc capable of storing high-definition (HD) video resolution. You need a Blu-ray player (regular DVD player does not work) that can be used in different venues, from real movie theatres to community centres, et cetera.

Audio and video on the discs correspond to full HD (1920 x 1080 pixels) and the sound is Dolby 5.1 multichannel stereo. The films will perform at their best when these technical requirements are available in the screening location.

If you don't have a Blu-ray player, it can be bought in electronic stores and online.

DCP format

For screenings in professional theatres you should contact SI for help with receiving an even more high definition format than Blu-ray, normally called Digital Cinema Package (DCP).

Test run

We strongly recommend pre-screening the films at least two weeks before an event to verify that everything looks and sounds as it should. Small technical variations occur in different parts of the world even if the main technical requirements are met. Sometimes noise levels and speaker systems need to be tuned.
